

Reason leads to error of askPassword() function:

- When askPassword() called, here is the information:
 - o Outer: Global
 - o This: undefined
- So at this point, the askPassword() function is losing “this” information.

Here is the fixed code as highlighted:

```
'use strict';

function askPassword(ok, fail) {
  let password = prompt("Password?", '');
  if (password === 'rockstar') ok();
  else fail();
}

let user = {
  name: "John",

  loginOK: function() {
    alert(`${this.name} logged in`);
  },
  loginFail: function() {
    alert(`${this.name} failed to log in`);
  },
};

askPassword(user.loginOK.bind(user), user.loginFail.bind(user));
```
